

# CIIIT INTERNSHIP

## TASK ASSIGNED: AUTOMATED DEFECT DETECTION IN CASTED METAL PARTS

### PROJECT DESCRIPTION

To develop a computer vision-based system capable of autonomously inspecting and identifying defects or imperfections in casted metal parts.

The system utilizes state-of-the-art deep learning techniques to automate the quality control process, ensuring that only high-quality parts proceed to further manufacturing stages.

By leveraging the power of artificial intelligence (AI) and machine learning (ML), the system enhances accuracy, consistency, and efficiency in defect detection

# SOLUTION

## STEP 1: DATA PROCESSING

Collecting, balancing, splitting, preprocessing, and augmenting a dataset of casted metal part images to train machine learning models for defect detection.

## STEP 3: MODEL PERFORMANCE ANALYSIS/TESTING

Test the model on various untested samples and analyse training and validation parameters

## STEP 2: MODEL TRAINING

Fine tune the pretrained model and train prepared data on Classification model.

## DEPLOYMENT

The classification model is versatile and deployable across a variety of environments, including Luxonis OAK, Raspberry Pi, NVIDIA Jetson, Docker containers, web pages, and Python scripts, tailored to the specific application requirements.

# STEP 1: DATA PROCESSING

## Description of Each Class Type:

The project involves classifying casted metal parts into two categories:

**Defective Parts:** This class includes casted metal parts that exhibit one or more defects or imperfections. Defects can range from surface irregularities, cracks, or incomplete casting.

**Non-Defective Parts:** This class comprises casted metal parts that meet the required quality standards and exhibit no detectable defects.

### Dataset Details

17486 Total Images

[View All Images →](#)

### Dataset Split

TRAIN SET

88%

15303 Images

VALID SET

8%

1453 Images

TEST SET

4%

730 Images

### Preprocessing

Auto-Orient: Applied

Resize: Stretch to 640x640

Grayscale: Applied

### Augmentations

Outputs per training example: 3

Flip: Horizontal, Vertical

90° Rotate: Clockwise, Counter-Clockwise

Rotation: Between -15° and +15°

Shear: ±15° Horizontal, ±15° Vertical

Hue: Between -63° and +63°

Saturation: Between -25% and +25%

Brightness: Between -25% and +25%

# MODEL TRAINING

## MODEL SUMMARY:

The model architecture consists of MobileNet V2 as a feature extractor, followed by Global Average Pooling and a Dense layer for prediction.

## BASE MODEL

MobileNet V2 was used as the base model, pre-trained on ImageNet.

## TOTAL PARAMETERS

The MobileNetV2 has 2.5 million non-trainable parameters, while the Dense layer has 1.2 thousand trainable parameters.

## TOTAL PARAMETERS

The last classification layers were excluded, and feature extraction was performed using the "bottleneck layer" for better generality.

## TRAINABLE VARIABLES

There are two trainable variables in the model: weights and biases in the Dense layer. The model was trained for 20 epochs on the specified dataset.

## FEATURE EXTRACTION:

The MobileNetV2 has 2.5 million non-trainable parameters, while the Dense layer has 1.2 thousand trainable parameters.

## MODEL COMPILATION

The model was compiled using RMSprop optimizer with a learning rate of 0.0001 and binary cross-entropy loss (from\_logits=True) since it provides linear output for binary

## GLOBAL AVERAGE POOLING DENSE LAYER :

Features were converted into a single 1280-element vector per image using Global Average Pooling.

A Dense layer was added to produce a raw prediction value (logit) for binary classification.

# TEST RESULTS

- Training accuracy: 99.95%
- Validation accuracy: 99.66%
- Test Accuracy: 99.45%

def front 100%

Confidence Threshold: 50%

0%  100%

```
{  
  "predictions": {  
    "def_front": {  
      "confidence": 0.999  
    }  
  }  
}
```
